ABSTRACTED-PUB-NO: EP 1013414A

BASIC-ABSTRACT:

NOVELTY - Reinforcing mat (10) has a layer of fibers (12) with a polymer layer (14,16) on each side to encapsulate the fibers, an adhesive overlay (18) on at least one outer surface of the assembly, and perforations through the fiber layer, the polymer layers, and the adhesive layer.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for: (i) A laminated board comprising a core layer and first and second reinforcing mats orientated with adhesive layers engaging the core layer and being bonded to form the laminated board; and (ii) the method of making a reinforcing mat.

Preferred Features: The fibers of the mat can be randomly oriented and of natural, organic, or inorganic material of micro denier to 100 denier. The perforations can be punched or vacuum formed, random or non-random, of 0.5 to 10 mm diameter and provide 5 to 95% of the area at a density of 1 to 250 holes per.sq.inch. The polymer layers and the adhesive can be applied to the fibers by coextrusion. A decorative layer can be applied to one surface of the laminated board.

USE - Particularly in the manufacture of vehicle head liners or interior panels.

ADVANTAGE - Reinforcing mat is easily formed and attached to, e.g., semi-rigid

polyurethane board to form a sound absorbing structure, in which the reinforcing mats, being perforated, do not degrade the sound absorption.

DESCRIPTION OF DRAWING(S) - The figure shows the mat.

ABSTRACTED-PUB-NO: WO 9944817A

BASIC-ABSTRACT:

NOVELTY - A sound absorbent laminate, which comprises an open porous fibrous or foam backing layer and a further open porous melt-blown microfiber layer and which has a specified air flow resistance, is new.

DETAILED DESCRIPTION - A sound absorbent thin layer laminate has an air flow resistance R_t of 500-4000 Ns/m^3 (exclusive) and comprises (a) an open porous backing layer consisting of a first fibrous layer, especially of lightly compressed nonwoven fabric of less than 2000 g/m^2 weight and less than 50 mm thickness, or an open porous foam layer, especially of an ultra-lightweight plastic foam of 16-32 kg/m^3 density and at least 6 mm thickness; and (b) a further open porous fibrous layer of melt-blown microfibers of 1-10 (especially 2-5) μm diameter. An INDEPENDENT CLAIM is also included for production of the above laminate by using a sprayed adhesive to fix the microfiber layer onto the backing layer.

USE - For noise reduction in motor vehicles, especially for lining instrument

panels, floors, doors, roofs, boot compartments and engine compartments (claimed).

ADVANTAGE - The ultra-light laminate has high acoustic insulation efficiency (especially a high low frequency sound absorption coefficient) and a certain structural stability, is water repellant and is simple and inexpensive to manufacture.

DESCRIPTION OF DRAWING(S) - The drawing shows a schematic view of a method of producing the new laminate.

ABSTRACTED-PUB-NO: EP 833973B

BASIC-ABSTRACT:

A method for attenuating sound comprises the steps of providing an acoustical insulation which includes a non woven web of thickness over 0.5 cm. and density <250 kg/m³, contg. organic micro-fibres and bonded together heat activatable staple fibres, and positioning the acoustical insulation transversely between a source and receiver of sound.

USE - A method of sound insulation using a non woven web with organic micro-fibres and heat bonded staple fibres.

ADVANTAGE - the web has sufficient strength not to require reinforcement.

ABSTRACTED-PUB-NO:
